“ highly skilled hand finishing techniques ”

The appearance of a product is one of the keys to its success. Working closely with the client, CMA's skilled team use hand-finishing techniques to achieve the appearance required. The various finishes range from spark textures (2) to high gloss (3).

The Fog Lamp Bezels (1) were required for road trials on a development vehicle. SLA master models were prepared to a high gloss finish before the mould making process. The required sets were produced in PU resin, then electro plated in chrome, giving the appearance of production parts.

Component Assembly

CMA offers a service of assembling components, either for a prototype build or a low volume production run. The Air Vents (4) were high temperature PU resin castings, via SLA and silicone mould tools. The Air Vents were fully assembled working units for vehicle environment testing.
